| Background: | The pattern of cellular proliferation and differentiation that leads to normal development of embryonic structures often depends upon the localized production of secreted protein signals. Cells surrounding the source of a particular signal respond in a graded manner according to the effective concentration of the signal, and this response produces the pattern of cell types constituting the mature structure. A segment-polarity gene known as dispatched has been identified in <i>Drosophila</i> and its protein product is required for normal Hedgehog (Hh) signaling. This gene is one of two human homologs of <i>Drosophila</i> dispatched. |
